

Simple vs Complex

Simple strategies take days to understand, test and implement, other complex strategies take months.

Simple strategies might entail grabbing the right assets and arranging them using straight-forward data science techniques to find opportunities.

Complex strategies might require you to learn web scraping, run servers and databases to store huge amount of data, run complex machine learning procedures, and only then can you start analysing the data for opportunities.

Complex strategies are not necessarily more profitable. In fact, simple is usually better in trading.

Simple strategies are easier to deploy, improve and are more resilient.

Approach

Simple is the low hanging fruit that we want to grab first.

In this course, we will start with simple and effective strategies that don't require you to have months of technical training.

We want you to get involved in the markets as soon as possible.
